

First step...

Result of “New.. Application...” (Lazarus 1.6.2, Windows 7, Oct 2018)

This is a basic skeleton. It is the code behind the form that is also created by “New... Application”. Nothing has yet been given a meaningful name.

Material `{{thus}}`- inserted by me, not part of the “automatic” text.

I have made changes to where lines break, and to some indenting. None that you will particularly notice, I hope!

=====

```
unit Unit1; {{1}}
```

```
{$mode objfpc} {$H+} {{2 (no semi-colon here... unusual)}}
```

```
interface {{3 (no semi-colon here... unusual)}}
```

```
uses Classes, SysUtils, FileUtil, Forms,  
Controls, Graphics, Dialogs; {{4}}
```

```
type {{5 (first line of “one item” spread across many lines)}}  
  TForm1 = class(TForm)  
  private  
    { private declarations }  
  public  
    { public declarations }  
  end; {{declaration of type TForm1 ends here}}
```

```
var Form1: TForm1; {{6}}  
{{“interface” ends here, because of the word that comes next...}}
```

```
implementation {{7 (no semi-colon here... unusual)}}
```

```
{$R *.lfm} {{8}}
```

```
{{Eventually, there will be lots of code here, to IMPLEMENT the things  
that the application needs, the things already “spoken of” in  
he “interface” section, above.}}
```

```
{{“implementation” ends here, because of the word that comes next...}}
```

```
end. {{End for “unit”. (Note the period (full stop) after “end”)}}
```
